

PRODUCT SPECIFICATION

ABUS 158 Series Combination

The 158 Series has been around for some time but recently reinvented to include more sizes. They work on the same principle of quality and reliability which can easily be felt when compared side by side with other similar products by other manufacturers. The similar range in Squire for example would be the CP Range which although good, do not compare in quality to the 158 Series.

The body is made from die cast metal zinc and the lock comes with a hardened steel shackle, resistant to hack-saw attacks which makes it very strong and resilient. The locks in this series are also weatherproof for normal outdoor use but not salt water environments. For salt water conditions see the 180ib range.

Another advantage to this padlock is that the combination can be changed easily when unlocked without the use of a key, but some may see this as a disadvantage. In a commercial situations whereby you would not want a disgruntled member of staff changing the code, you may opt for a padlock where a special key is used to change the combination. For example the ABUS 190CS/60 or the Shield C50.

Padlock Features:

- Solid zinc die-cast lock body
- Hardened steel shackle
- Double bolted shackle for protection against pulling
- Set your own code
- Designed in Germany
